

## Selection and Production of Recombinant Binders for Use in Protein Microarrays

By Mark Laible

GRIN Verlag Sep 2011, 2011. Taschenbuch. Book Condition: Neu. 211x146x10 mm. This item is printed on demand - Print on Demand Neuware - Diploma Thesis from the year 2009 in the subject Biology - Micro- and Molecular Biology, grade: 1,1, German Center of Cancer Research Heidelberg, language: English, abstract: Antibodies are essential everyday tools for molecular biologists and much depends on their performance and availability. Large numbers of antibodies are available already, however, these cover only a small part of the known proteome. The generation of antibodies for proteome-wide studies using conventional methods, which are based on animal immunisation, would be hardly feasible and not sustainable. Recombinant binders may be able to fill the gap of missing affinity reagents. The main advantages of recombinant binders are (1) the wide availability in form of fully synthetic DNA libraries (2) the independence on animal immunisation, which still is the main source of antibodies today and (3) the possibility to design completely new classes of synthetic binders with defined properties. The aim of this work was to establish the selection and purification of recombinant binders for use in protein microarrays. Binders were selected from a synthetic library of single chain fragment variable (scFv)...

### Reviews

*Totally one of the better publications I have actually read through. It really is really fascinating through studying time period. It's been printed in an extremely simple way and is particularly just following I finished reading through this ebook in which basically modified me, modify the way I think.*

-- **Mrs. Maudie Weimann**

*A really great publication with perfect and lucid explanations. Of course, it is play, continue to an amazing and interesting literature. I discovered this book from my i and dad suggested this publication to find out.*

-- **Dr. Augustine Borer**
